

Final Project

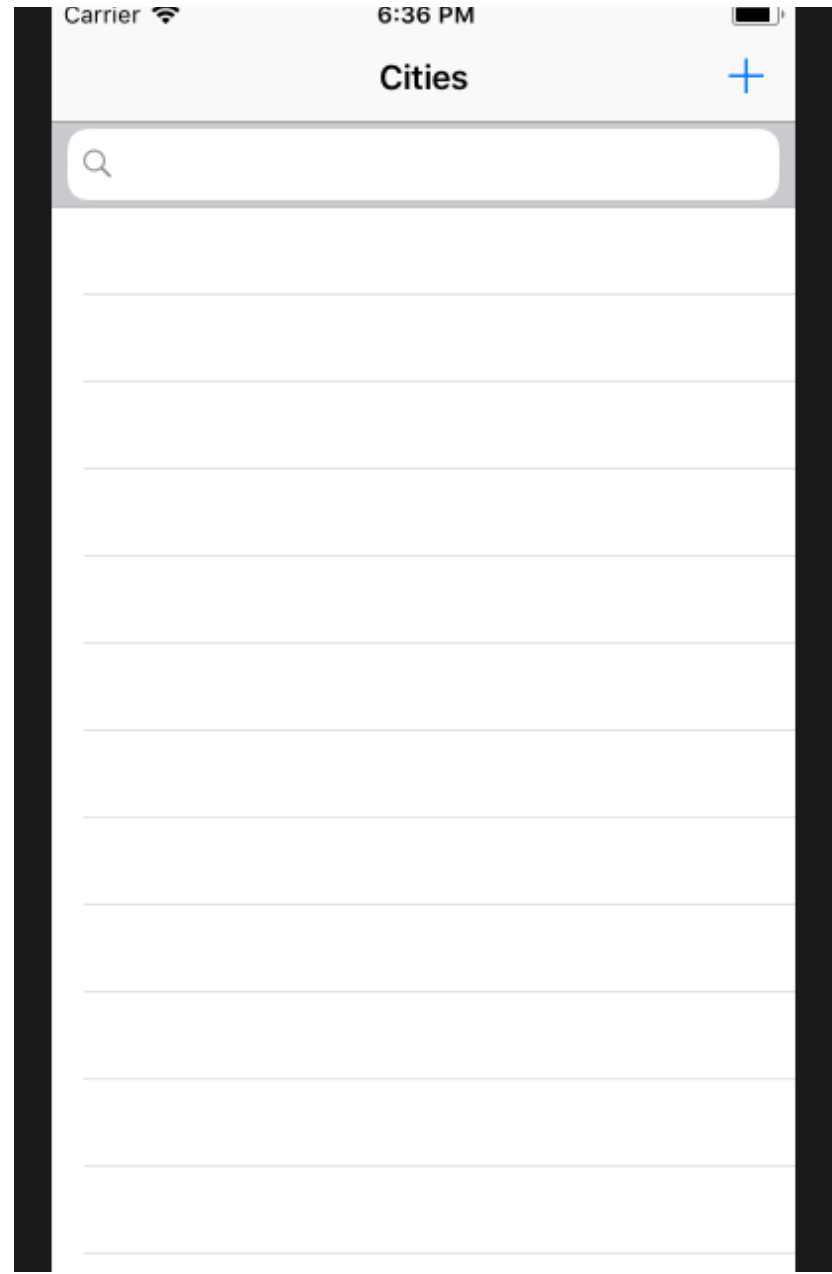

Weather APP

Users can check the weather for any of their favourite cities

Initial ViewController

List of all cities that is saved to coredata, initially empty.

by pressing the add button (+) app will segue to the searchviewController

Search ViewController

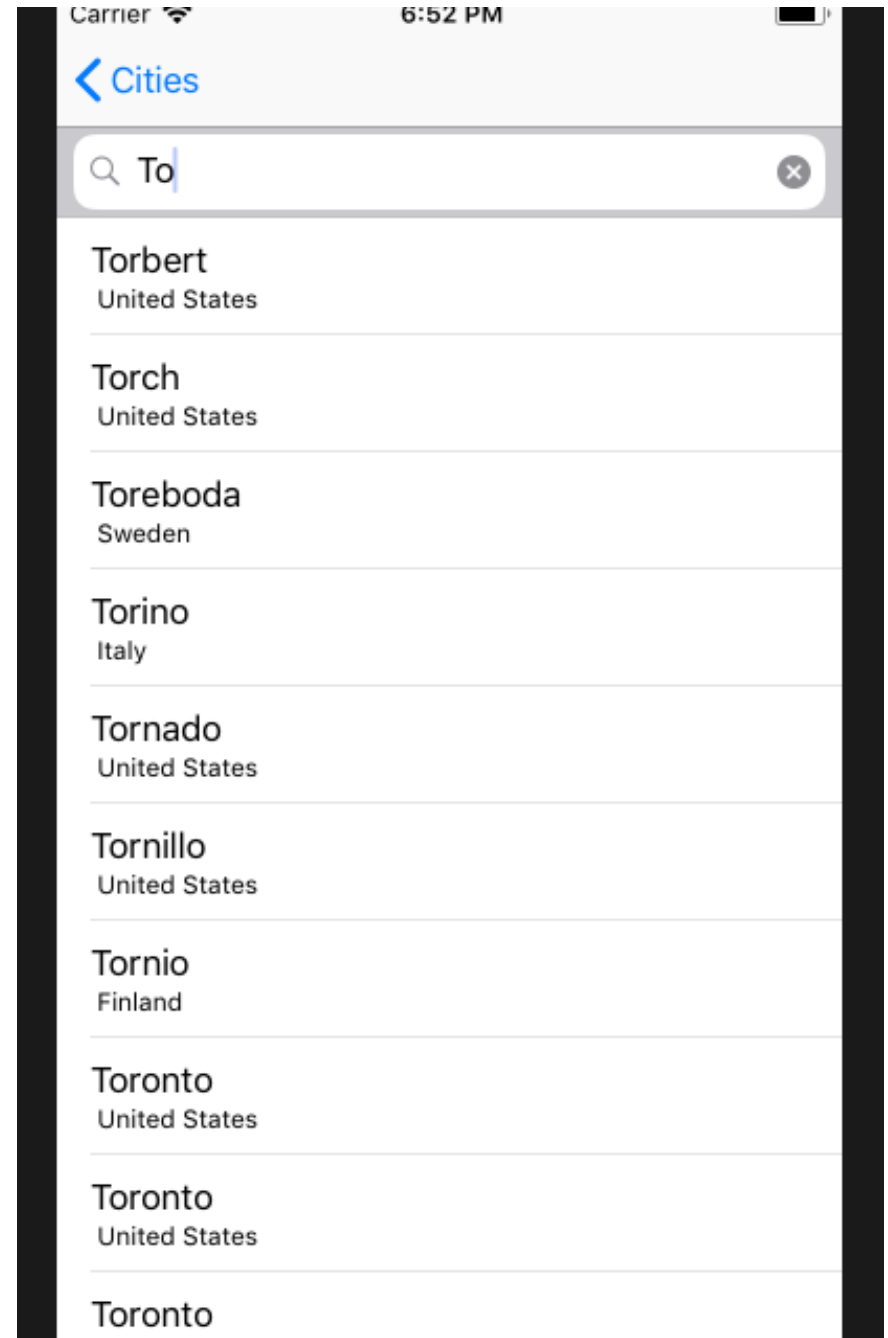

choose any city search api for
example

<http://gd.geobytes.com/AutoCompleteCity?callback=?&q=tor>

- user can search for a city using the
searchbar

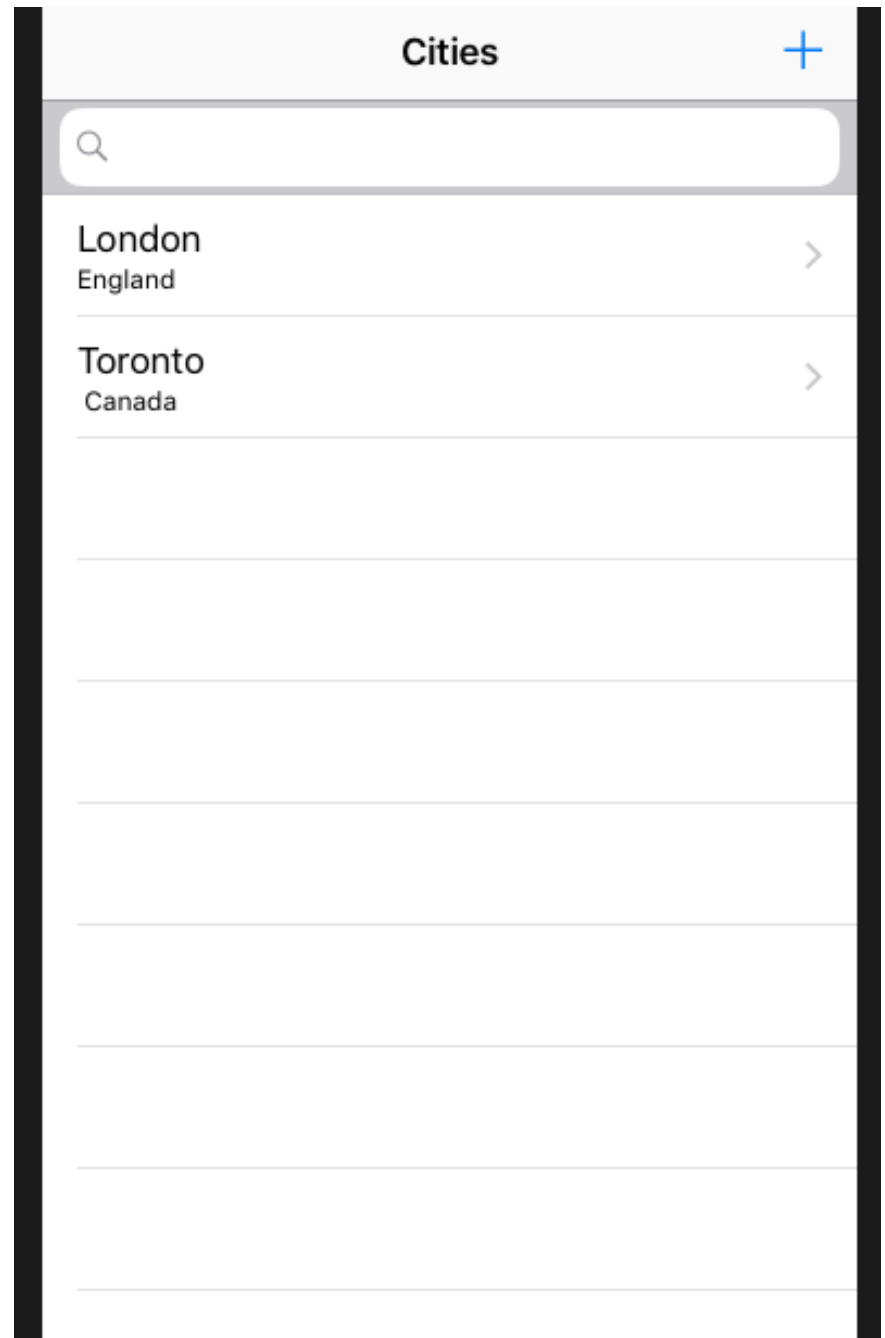

- selecting any row will save the city's
name and country to <coredata>
driven database

- have an indication that information
has been saved
eg popup message. (see what feels
natural)

Initial ViewController

- InitialViewController has the updated information from the database
- user should be able to search through this information by using the searchbar
- user can select any of cities

Detail ViewController

- User Will be able to see the current weather for this location
- set the title of the viewController accordingly
- use openweathermap.org
